Mock model question paper

Original sample material for demonstration and self-practice. Not an official company paper, an authentic previous-year paper or a statement of the company's hiring process.

Suggested time: 25 minutes | 5 questions | Self-practice

01. An item priced at INR 1120 is discounted by 10%. What is its sale price?

02. A vehicle travels 276 km in 4 hours. What is its average speed?

03. Why is idempotency especially useful for payment requests?

04. What should a service do with an invalid webhook signature?

05. Why should monetary values avoid binary floating-point arithmetic?

Razorpay - Answer guide

MOCK MATERIAL / Suggested answers for self-review

01. An item priced at INR 1120 is discounted by 10%. What is its sale price?

INR 1008. The discount is 1120 x 10/100 = 112; subtract it from the original price.

02. A vehicle travels 276 km in 4 hours. What is its average speed?

69 km/h. Average speed = distance / time = 276 / 4.

03. Why is idempotency especially useful for payment requests?

A client may retry after a timeout without knowing whether a charge succeeded. Idempotency ensures the same operation does not create multiple charges.

04. What should a service do with an invalid webhook signature?

Reject the request without applying the event. Verify signatures using the provider's documented method and keep replay protection in place.

05. Why should monetary values avoid binary floating-point arithmetic?

Many decimal fractions are not represented exactly in binary. Integer minor units or an appropriate decimal type help preserve exact amounts.
