Swiggy

Mock model question paper

Original sample material for demonstration and self-practice. Not an official company paper, an authentic previous-year paper or a statement of the company's hiring process.

Suggested time: 25 minutes | 5 questions | Self-practice

01. An item priced at INR 1040 is discounted by 20%. What is its sale price?

02. A vehicle travels 126 km in 2 hours. What is its average speed?

03. Which algorithm finds the shortest path when all road weights are non-negative?

04. A user taps Place order twice. How can you prevent duplicate orders?

05. Why should a delivery estimate show a range rather than a guaranteed minute?

Swiggy - Answer guide

MOCK MATERIAL / Suggested answers for self-review

01. An item priced at INR 1040 is discounted by 20%. What is its sale price?

INR 832. The discount is 1040 x 20/100 = 208; subtract it from the original price.

02. A vehicle travels 126 km in 2 hours. What is its average speed?

63 km/h. Average speed = distance / time = 126 / 2.

03. Which algorithm finds the shortest path when all road weights are non-negative?

Dijkstra's algorithm finds shortest paths for non-negative edge weights. A priority queue improves efficiency.

04. A user taps Place order twice. How can you prevent duplicate orders?

Use an idempotency key and a server-side uniqueness constraint so repeated requests return the same operation result.

05. Why should a delivery estimate show a range rather than a guaranteed minute?

Traffic, preparation time and travel conditions vary. A range communicates uncertainty more accurately.
